Temperature					
°F = (1.8 x °C) + 32			°C = (°F-32) x 5/9		

Main Alloying Elements in Nickel Alloys	
Cr	In the presence of oxygen, creates a passive protective film resistant to corrosion.
Cu	Improves the resistance to reducing acids and salts.
Mo	Improves the high temperature strength, pitting and crevice corrosion. Also improves resistance to reducing acids.
Fe	Influences passivation and controlled thermal expansion additon.
Si	Improves oxidation and carburization resistance.
Nb+Ta	Increase solid solution strength.
W	Improves high temperature strength, pitting and crevice corrosion resistance.
